UniCC: A universal LALR(1) Parser Generator
User Manual

UniCC is a target-language independent parser generator. It compiles an augmented grammar definition into a program source code. Because UniCC is intended to be a target-language independent parser generator, it can be configured via template definition files to emit parser programs in probably any programming language.

This manual gives a detailed introduction into the software, and serves both as a reference guide and a practical information resource for using UniCC in real-world applications.

UniCC supports out-of-the box support for the programming languages C and Python. More target languages can easily be integrated and made available.
